

FULL-STACK PROJECT • LIVE DEMO

I built & deployed a Stripe Payment Gateway

A secure checkout portal that accepts **any custom amount** —
no products pre-configured in Stripe. Containerized with
Docker and running live on AWS.

Node +
Express

Stripe

Docker

AWS
EC2

THE IDEA

Most payment demos make you pre-build every product in Stripe.

I wanted a gateway where a customer just **types in any amount** and pays — instantly. No dashboard setup, no hardcoded Price IDs.

The solution

The Express backend generates the price on the fly using Stripe's inline `price_data`. One endpoint, any amount, fully dynamic.

A glassmorphic checkout portal

}
```

WHAT IT DOES

Key features

Dynamic amounts

Any custom USD value, generated server-side with inline price_data — no products pre-configured.

Secure key injection

The Stripe publishable key is served at runtime, never committed to source.

Environment-agnostic

Redirects resolve from request headers — one build runs on localhost, staging or production.

Dockerized & cloud-deployed

Ships with a Dockerfile and runs live on an AWS EC2 Ubuntu instance.

UNDER THE HOOD

Tech stack & flow

FRONTEND

HTML • CSS • JS

BACKEND

PAYMENTS

Stripe Checkout

INFRA

Docker • AWS EC2

1 • Input

Customer enters amount + email

2 • Session

Express builds Stripe session

3 • Pay

Stripe-hosted secure checkout

4 • Confirm

Redirect to /success or /cancel

Satnam.pay

Try it. Read the code.
Tell me what to build next.

It's live and open-source. I'd love your feedback.
